MORE THAN MONEY · MTM EDUCATOR

ROCKETNOVA

Three averages, launch stars, the Rocket Candle and a volatility pulse. The signal is born on a confirmed cross next to a star, and the plan stays fixed on the candle: entry, stop and four targets.

STYLE	ASSETS	TIMEFRAMES
Trend following, with structure and trade management	Forex, gold, indices and crypto	Any: 5 and 15 minutes intraday, 1 hour and 4 hours for swings

01

The strategy in a few words

RocketNova reads the trend with three exponential averages: 20, 50 and 238. The signal is born when the fast one crosses the slow one and the candle closes. But the cross alone is not enough: by default a buy requires a recent low star and a sell a recent high star, the launch pad.

Stars are swing highs and lows confirmed by three settings: Depth (34 bars to the left), Deviation (1.3 ATR from the previous opposite star) and Backstep (8 bars to the right). The Rocket Candle, a candle with a 1.2 ATR body closing in its extreme, shows the impulse. The Volatility Pulse compares ATR with its average and the Trade Clock shows whether you are in session and with volume.

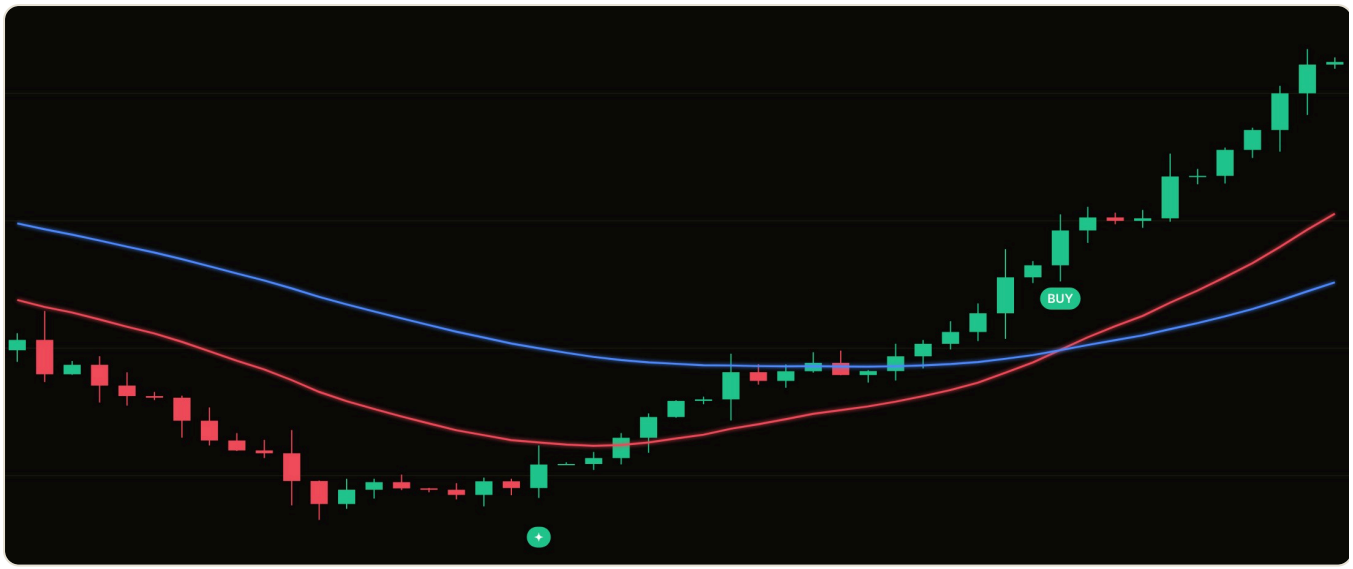

Entry, stop and TP1 to TP4 stay fixed on the signal candle. After TP1 the stop moves to entry; an opposite signal closes the trade. Everything goes out by alerts with the same id, ready for webhooks.

02

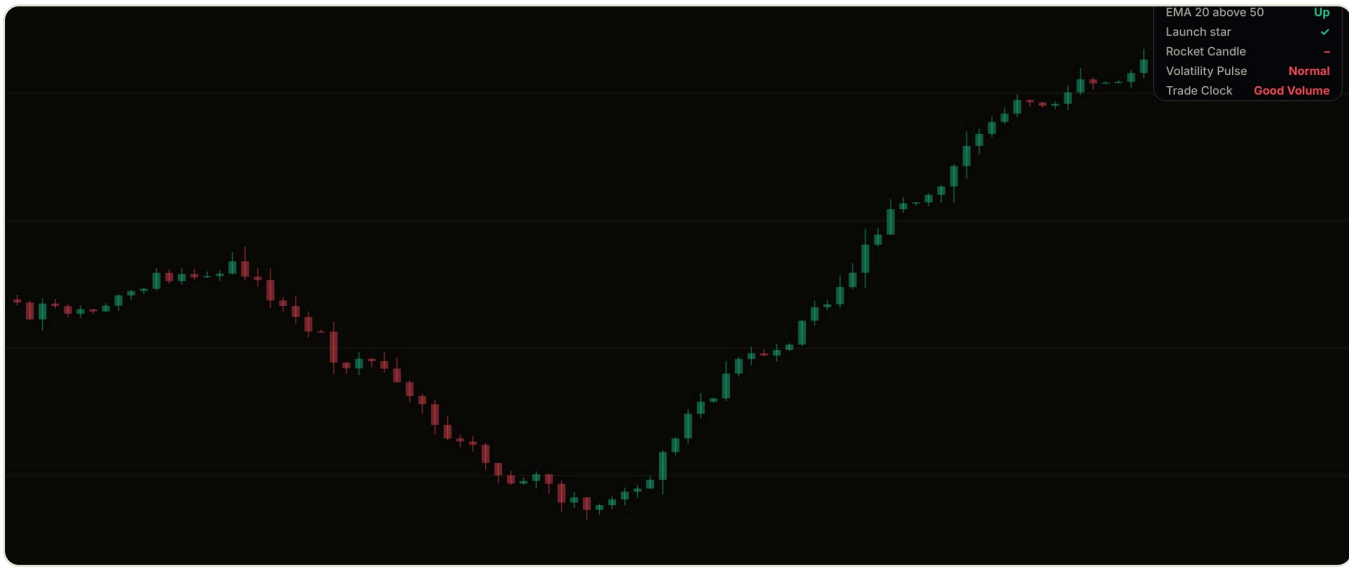

What you see on the chart

The three averages. 20 EMA (red), 50 EMA (blue) and 238 EMA (orange). The order of the averages tells the side of the market.

The stars. Green ✦ on a low, red ✦ on a high. They appear after the Backstep bars.

The panel. Trend, star, Rocket Candle, Volatility Pulse and Trade Clock, candle by candle.

03

The confirmations

1. Trend: the 20 EMA crossed the 50 and the candle closed. With the 238 EMA filter on, buys only above and sells only below the long average.
2. Launch star: there is a recent swing low for a buy, or a swing high for a sell, within the last 40 bars.
3. Rocket Candle: an impulse candle in favour within the last bars confirms strength (optional filter).
4. Volatility Pulse: ATR is Normal or High. On Low, the market is quiet and targets take longer.
5. Trade Clock: you are inside the session (08:00 to 21:00 by default) and the chip says Good Volume.

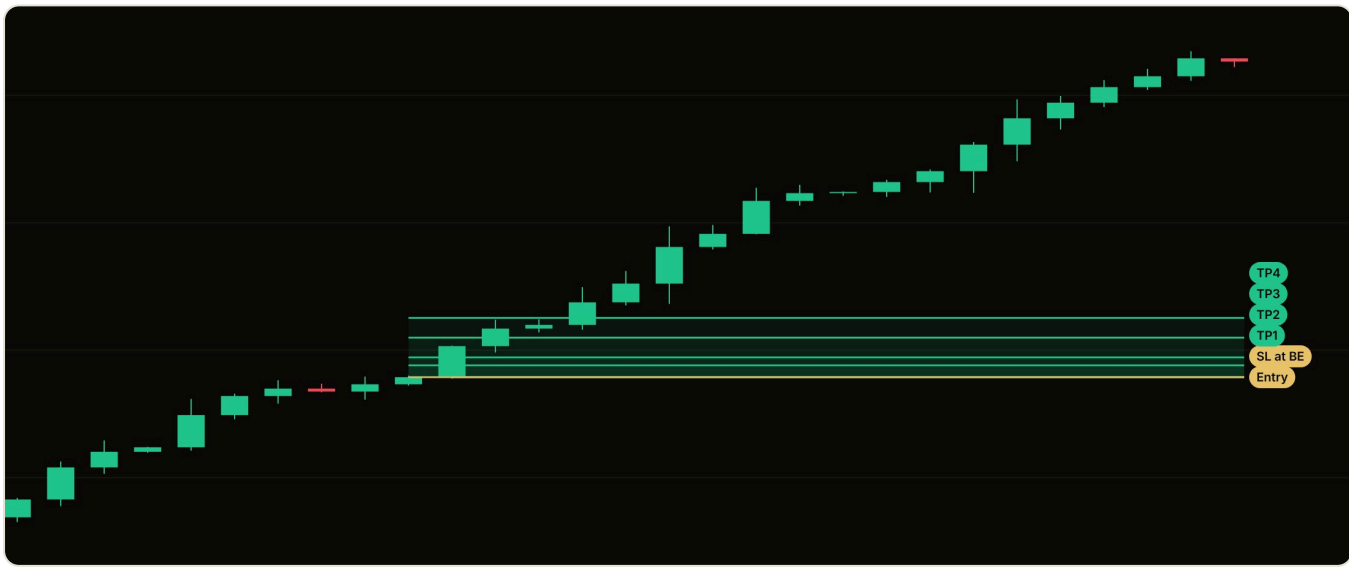

04

Entry and management

1. Enter at the close of the signal candle, at the Entry label price.
2. The stop is fixed (100 pips, 200 on gold) or sits at the last opposite star with a 0.2 ATR buffer. Size the position by the risk to the stop.
3. TP1 to TP4 at 30%, 50%, 100% and 150% of the stop (60% for TP2 on gold). Close a part at each target.
4. At TP1 the stop moves to entry: from here the trade cannot lose.
5. An opposite signal closes whatever is left. Never move the stop against you.

The plan on the chart. Entry, SL and TP1 to TP4 fixed on the signal candle.

The management. After TP1 the stop moves to entry (SL at BE).

05

When not to enter

1. On a cross without a recent star, or with the star on the wrong side.
2. With the Trade Clock on Market Closed or Low Volume.

3. With the Volatility Pulse on Low and price glued to the averages.
4. Against the 238 EMA without a clear reason.
5. Around high-impact news.

06
The alerts

1. Create the alert with "Any alert() function call" and "Once Per Bar Close". The entry arrives with direction, entry, stop and the four targets; follow-ups of the same trade arrive with the same id: tp1 to tp4, sl, be and exit. This is what feeds the MTM Auto RocketNova chat and Tap to Trade.

07
Pocket checklist

- [ ] Side of the 238 EMA
- [ ] Closed cross
- [ ] Recent star on the right side
- [ ] Rocket Candle (if on)
- [ ] Pulse Normal or High
- [ ] Trade Clock on Good Volume
- [ ] Size by risk
- [ ] Stop to entry at TP1
