MORE THAN MONEY · MTM STRATEGIES

Premium Scanner

The Premium room gold signals turned into rules: a five-question vote, a pullback entry in a $5 zone, a fixed stop and four targets.

Strategy guide

STYLE	ASSETS	TIMEFRAMES
Intraday, with the move, pullback entry	Gold (XAUUSD)	15 minutes, in the Asia, London and New York sessions

01

The strategy in a nutshell

The Premium Scanner came out of studying the gold signals posted in the Premium room. We measured every signal (direction, time, zone, stop and targets) and turned what they share into rules.

Direction comes from a five-question vote on price movement. The entry doesn't chase price: it waits for a pullback into a $5 zone, with the stop and the targets always at the same distance.

It only works on gold, on the 15-minute chart, and only inside the sessions. It draws the zone, the stop and the targets with the price of each level, and sends the same in an alert.

02

What you see on the chart

Three sessions. Asia 00:00–06:00, London 07:00–11:00 and New York 13:00–16:00 (UTC). Each has its own switch. Outside them, the scanner gives no signals.

The five-point vote. Price versus the session open, versus 1 hour ago, versus 4 hours ago, versus the 200 average and versus the 9 average. The majority decides buy or sell.

Zone, stop and targets. A $5 gold zone, its middle $4 against price. Stop $5 beyond the zone. Targets $5, $10 and $15 from the zone edge, and a fourth at $20 to let it run.

03

The confirmations

The scanner only fires when all of this holds, at the close of the 15-minute candle:

1. You're inside an active session (Asia, London or New York).
2. The vote is decided: a majority of the five questions (Majority mode) or all five (Unanimous mode).
3. At least half an hour has passed since the previous signal.
4. There haven't been six signals in this session yet.

04

Entry and management

1. On the signal, place a limit order in the middle of the gold zone.
2. If the order isn't filled within 4 candles (1 hour), cancel it.
3. Stop $5 beyond the zone. Size the position by the risk you accept to lose at that stop.
4. At the first target close half of the position and move the stop to the entry price.
5. Close a quarter at the second target and the last quarter at the third, or let it run to the fourth target.
6. Each exit percentage and the distances of the zone, stop and targets can be edited in the settings.

05

When not to enter

- On any asset other than gold, or any timeframe other than 15 minutes: the distances are measured for gold on 15 minutes.
- Outside the sessions or in a session you switched off.
- When the order wasn't filled in the first hour: that signal is gone.
- With a fixed lot instead of a lot sized by risk.
- On a live account before practising the rules on demo.

06

In practice

All the way to the third target. Buy in London on 23/10/2026. The order fills in the zone, the stop moves to entry at the first target and the trade closes at the third.

First target, then out at entry. Sell in London on 27/10/2026. Half comes off at the first target; price turns back and the rest exits at entry, with no loss.

When it hits the stop. Sell in London on 26/10/2026. The order fills, but price never reaches the first target and hits the stop. The loss was set before the entry.

07

Pocket checklist

- [ ] Gold on 15 minutes
- [ ] Inside the session
- [ ] Arrow at candle close
- [ ] Limit order mid-zone
- [ ] Cancel after 1 hour
- [ ] Size by risk
- [ ] 1/2 at first target, stop to entry
- [ ] 1/4 at second, 1/4 at third
