MORE THAN MONEY · MTM STRATEGIES

Sniper Pro

Intraday scanner on 15 minutes: the score candle gives the signal, the 4 hour trend decides whether you take the trade.

Strategy guide

morethanmoney.pt

STYLE

Intraday, reversal and impulse, with trend confirmation on a higher timeframe

ASSETS

Forex pairs (in the examples, EURGBP and AUDCAD)

TIMEFRAMES

Entry on 15 minutes, confirmation on 4 hours. On 5 minutes confirm on 1 hour; on 1 minute confirm on 15 or 30 minutes

01

The strategy in a nutshell

Sniper Pro is MTM's intraday scanner. It uses its own indicators to spot opportunities and delivers the signal almost ready-made: a score, an arrow, the stop, two targets and a retest zone.

Reading starts with the score candle, but the most important step is going up to the higher timeframe. A sell is only taken with a bearish bigger trend; a buy, with a bullish one.

The scanner only shows the last two signals on each pair. Practise the same routine on demo, log every trade and only then move to a live account.

02

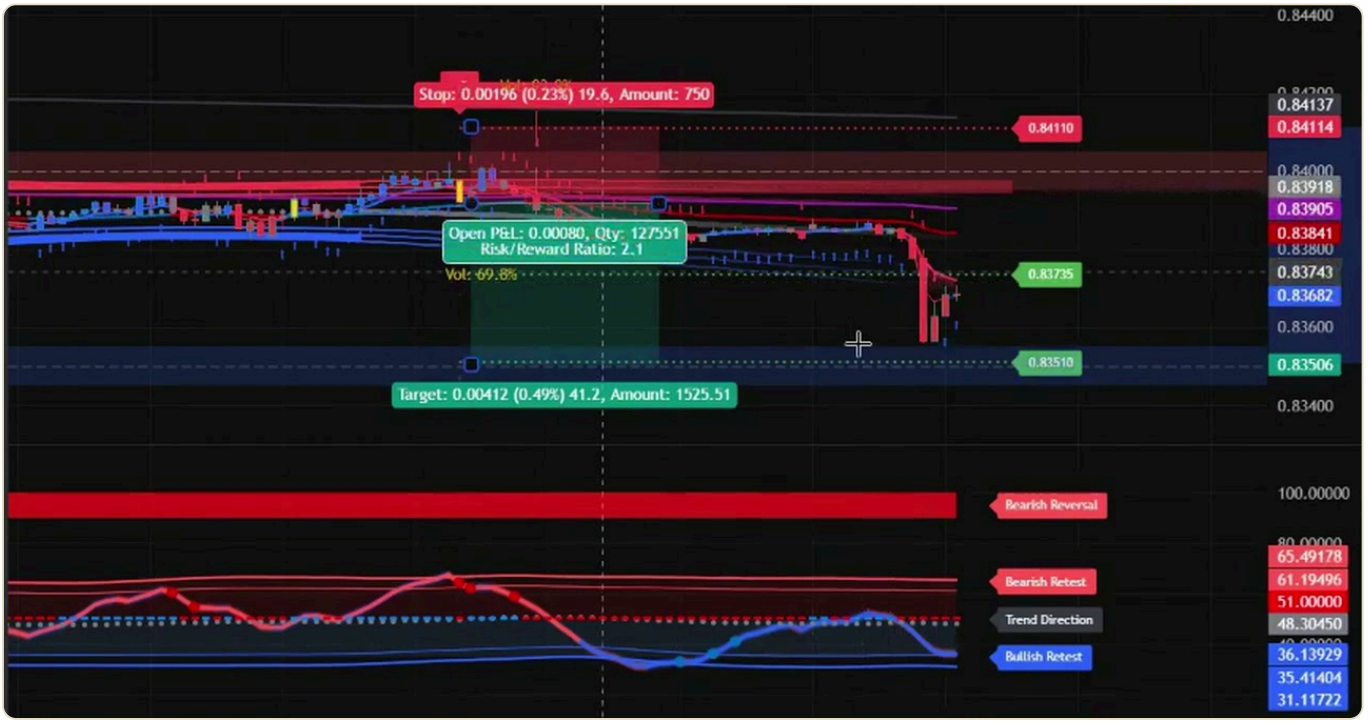

What you see on the chart

Score candle. A label with a plus and a number, from +3 to +10, above or below the candle. Each point is a scanner condition that's been met. Red is bearish, blue is bullish. Next to it is the candle's volume, as a percentage.

Gold candle and Sniper arrow. The gold candle is the strongest and signals a more intense impulse or reversal. On a sell, the Sniper arrow is red and sits above the candle. The bigger version, the super arrow, appeared on AUDCAD, on a +9 gold candle.

Stop and two targets. When the signal prints, the scanner draws the stop as a red dashed line and two targets, TP1 and TP2, as green lines. On EURGBP, the chart's position tool showed a risk/reward of 2.1.

Pivots and key zones. Key zones are shaded areas based on round numbers: wholes, halves and quarters. Pivots (R1 to R5 and S1 to S5, on the right margin) are calculated from the previous day's open, high, low and close. They serve as extra confirmation or additional targets.

Sniper oscillator. The lower panel shows bearish and bullish reversal, the retest, trend direction, the red and blue crosses and real-time divergence, marked with the letter D.

03

The confirmations

Once the score candle appears, check the confirmations in this order. The example is a sell; on a buy everything is reversed.

1. Score. Favour high scores, like +8 and +9, which have more conditions in their favour. A low score, like +3, has few. The source sets no official minimum.
2. Bigger trend. Enter on 15 minutes and confirm on 4 hours in the trend table. Sell only with a bearish 4 hour; if it's bullish, don't take the setup. Do this step first.
3. Signal candle. On a sell it has to be red, with the red Sniper arrow above it. The exception is the gold candle, which is stronger.
4. Short-term moving average. It should be red at the time of the candle, on a sell.
5. Volume. The signal candle's volume should be high. On AUDCAD it was 96.8%.
6. Key zone and pivots. Ideally price is in a key zone with two pivots inside it. They're not mandatory: they're additional confirmations.
7. Oscillator. On the signal candle: red Sniper line, bearish retest, red cross, red trend and, when present, real-time divergence.

04

Entry and management

1. When the score candle appears, don't enter right away. Confirm first, one by one, in the order above.
2. Go up to the 4 hour chart and read the trend table. If it's against the signal, let it go.
3. Enter on the signal candle, or wait for the retest in the shaded zone. When price reaches about 50% of the zone, that's a second chance. Price often doesn't come back and the trade is missed.
4. Use the stop the scanner draws, above the signal's high on a sell.
5. Targets at TP1 and TP2. On EURGBP, TP1 wasn't even 1:1 and TP2 was about 1:2, which was enough to take the trade. Risk management is up to each trader.
6. Once price passes TP1, you can move the stop to that area if you want. Pivots serve as extra targets. Then wait for the next signal.

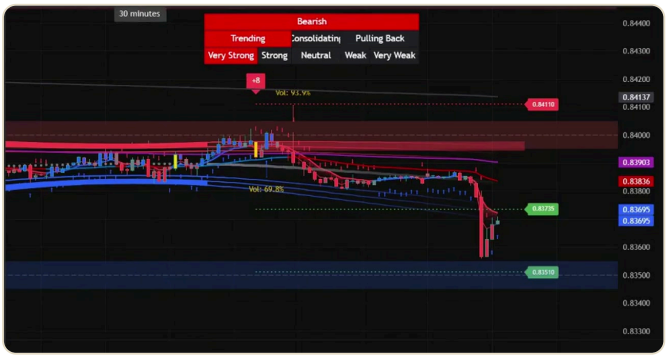

05

When not to enter

- A sell with a bullish 4 hour (or a buy with a bearish 4 hour).
- When the signal candle isn't the signal's colour, unless it's gold.
- Going only by the trend on the timeframe you trade, instead of the higher one.
- With a low score, like +3, that has few conditions in its favour.
- Counting on the retest as a given: price may not come back to the zone.
- On a live account without first practising the strategy on demo.

06

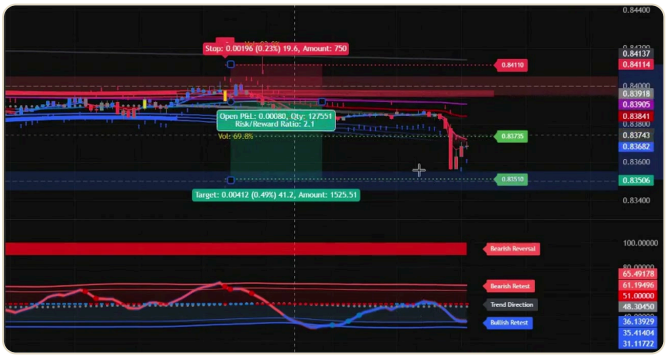

In practice

EURGBP, +8 sell. Gold candle with a red arrow, 93.9% volume and the trend table bearish, Trending and Very Strong. The scanner drew the stop at 0.84110 and the targets at 0.83735 and 0.83510.

Oscillator lined up. On the EURGBP gold candle, the oscillator shows the bearish retest and the line in red, in favour of the sell.

Risk/reward measured. With the position tool, stop and target give a risk/reward of 2.1. At entry, TP2 was about 1:2.

AUDCAD, +9 sell. A bearish +9 on a gold candle, in a key zone, with the stop and both targets drawn. Further down there's a bullish +3, a low score.

Bigger trend on 4 hours. On AUDCAD, the 4 hour table is bearish, in favour of the sell. This is the step that validates the 15 minute signal.

Volume and retest zone. +9 with 96.8% volume and the shaded retest zone. The initial entry was missed; the retest is a second chance. The trade's result wasn't shown.

07

Pocket checklist

- [ ] High score candle (+8 or +9 preferably)
- [ ] 4 hour trend on the signal's side
- [ ] Signal candle in the right colour with the Sniper arrow, or a gold candle
- [ ] Short-term moving average in the signal's colour
- [ ] High volume on the signal candle
- [ ] Key zone with pivots, as extra confirmation
- [ ] Oscillator lined up: line, retest, cross and trend
- [ ] Scanner's stop and targets (TP1 and TP2) drawn
- [ ] Risk and position size set before entering
