MORE THAN MONEY · MTM STRATEGIES

Sensei

Several readings, one confluence: structure, double averages, POC, the Sensei band and order flow. The signal only fires when the confirmations reach the minimum.

Strategy guide

STYLE

Confluence of confirmations, with styles from scalp to swing

ASSETS

Forex, indices, gold and crypto

TIMEFRAMES

Scalp: 5 and 15 minutes · Intraday: 1 hour · Swing: 4 hours

01

The strategy in a nutshell

Sensei brings together MTM Scanner's structure engine, double averages and POC, the Sensei band (an 89 average with one standard deviation) and order flow from a lower timeframe.

Each reading counts as a confirmation: there are 20, in four groups of five. The signal only appears when the score passes the chosen style's minimum (12 out of 20 in custom mode), with higher-trend and anti-chop filters.

Levels stay fixed on the signal candle: a 1.5 ATR stop and four exits at 1.5, 2.5, 4 and 6 R, with the stop moving to entry after the first. By default it only gives buys; sells can be switched on in the settings and require extra confirmations.

02

What you see on the chart

The Sensei band and cloud. An 89 candle average with one standard deviation. Purple with price above (uptrend), grey with price below.

Structure. Breaks of structure, changes of character, liquidity sweeps and order blocks.

The confirmations panel. Four groups: the double averages' trend; volume, strength and momentum; structure and POC; band and buying pressure. The score has to pass the style's minimum.

Four exits in R. Stop at 1.5 ATR (or a percentage) and Exit 1 to 4 at 1.5, 2.5, 4 and 6 R, 25% at each. After Exit 1, the stop moves to entry.

03

The confirmations

Sensei counts the confirmations for you. Your part is to check the filters and read the panel carefully.

1. Higher trend in favour: buys above the 200 average on the 4 hour chart, sells below.
2. A market with strength: the anti-chop filter blocks signals when the trend is weak.
3. A closed candle: the signal only appears on the close, so it doesn't disappear later.
4. A score above the minimum with no empty groups: a high score with no structure points, for example, is a warning.
5. Size by risk, down to the 1.5 ATR stop.

04

Entry and management

1. Choose the style by the time you have (scalp, intraday, swing) or use the optimised mode.
2. Read the context: higher trend, cloud colour, structure.
3. Wait for the score to pass the minimum and check that no group is empty.
4. Enter on the close of the signal candle with the size worked out from risk.
5. At Exit 1 close a quarter and move the stop to entry.
6. Close another quarter at each following exit; exit earlier if structure changes character against you, the cloud turns grey or the score falls.

05

When not to enter

- Against the 4 hour 200 average.
- With the market moving sideways (the anti-chop filter helps, but check it yourself too).
- With the score at the limit and whole groups empty.
- With price already far from the signal.
- On sells without knowing they're off by default and require extra confirmations.

06

In practice

Exit 1 and stop to entry. A quarter out at Exit 1 and, from then on, the worst case is getting out at zero.

A market with no strength. With price moving sideways, the anti-chop filter blocks the signals.

07

Pocket checklist

- [ ] Higher trend in favour
- [ ] Market with strength
- [ ] Closed candle
- [ ] Score above the minimum
- [ ] No empty group
- [ ] Size by risk
- [ ] Stop to entry at Exit 1
