MORE THAN MONEY · MTM STRATEGIES

Aurum Flow

Opening range breakout: the session draws the box, the underlying trend picks the side, the stop sits on the opposite edge and the targets are in R.

Strategy guide

morethanmoney.pt

STYLE	ASSETS	TIMEFRAMES
Opening range breakout (ORB), with the underlying trend	Crypto perpetuals (main); gold as a secondary mode	15 minutes; box = the session's first hour

01

The strategy in a nutshell

Aurum Flow marks the opening range of each session (Pre London, London and New York) and waits for price to break it with the underlying trend.

The regime comes from the 200 exponential moving average on the 4 hour chart: above it, only buys; below it, only sells. The signal only fires on the candle close.

The stop sits on the opposite edge of the box, with a buffer, and the targets are multiples of risk (3, 6, 10 and 16 R). The panel works out the size from the risk you set: notional and leverage on perpetuals, lots on gold.

02

What you see on the chart

The session box. High, low and range of the session's first hour. During the hour the box grows; then it's fixed and becomes the day's reference. Times come in Lisbon time and adjust to your time zone.

The breakout. A candle closes outside the box, on the underlying trend's side: above the high to buy, below the low to sell.

Stop and targets in R. The stop sits on the opposite edge of the box. The distance to it is one R; the targets sit at 3, 6, 10 and 16 R. At the first target you move the stop to entry.

Structure underneath. The same structure engine as Sensei (breaks and changes of structure) runs underneath. Here it's only for reading.

03

The confirmations

The scanner only gives the signal when these conditions are met. Knowing them helps you understand why some breakouts don't produce a signal.

1. Regime: price on the right side of the 200 average on the 4 hour chart.
2. Normal volatility: neither a flat market nor an extreme spike.
3. Momentum in favour: relative strength index above 55 on buys, below 45 on sells.
4. No exhaustion candle: the breakout candle can't be more than 2.5 times the average volatility.
5. Stop above the cost: the stop must be at least 9 times the round-trip fees, and never more than 3.5% of price.

04

Entry and management

1. Wait for the session box to close.
2. Check the regime: only look for the breakout on the side of the 4 hour 200 average.
3. Let the scanner validate the signal on the candle close.
4. Read the entry, stop, targets and dollar risk in the panel, and enter with the size it worked out.
5. At the first target (3 R), move the stop to entry.
6. Let the rest run to 6, 10 and 16 R, or close in parts at each target.

05

When not to enter

- Before the box has closed.
- With the breakout against the 4 hour 200 average.
- After too many candles since the box closed: the range has expired.
- With a bigger size than the panel worked out.
- To move the stop further away when price comes back into the box.

06

In practice

Protect at the first target. At 3 R the stop moves to entry and the rest of the position runs with no risk.

False breakout. Price closes outside, comes back in and crosses the box to the stop. You lose 1 R, as planned.

07

Pocket checklist

- [ ] Box closed
- [ ] Regime in favour
- [ ] Signal on the close
- [ ] Panel size
- [ ] Stop on the opposite edge
- [ ] Stop to entry at 3 R
- [ ] Let it run to 6, 10 and 16 R
