MORE THAN MONEY · MTM STRATEGIES

GoldKiller

Gold with clear targets: the SuperTrend gives the trend, the flip gives the signal and percentile levels give realistic targets and drawdowns.

Strategy guide

STYLE	ASSETS	TIMEFRAMES
Trend following on gold, for day trading and swing trading	Gold (XAUUSD)	15 minutes as the reference; 1 hour and 4 hours for swing

01

The strategy in a nutshell

GoldKiller is our scanner for gold. It follows the trend with a SuperTrend line and, on every flip, shows how far price usually goes for you and against you.

The line measures the average volatility of the last ten candles and sits three times that distance from price, built on a smoothed price that weighs the close more. Green below price: uptrend. Red above: downtrend.

On every flip the scanner records the maximum gain and maximum drawdown of the previous legs and draws them as percentile levels from the entry. It's an analysis tool: it does not place orders.

02

What you see on the chart

The SuperTrend line. Green and below price in an uptrend, red and above in a downtrend. It follows price and never moves back against the trade.

The flip: BUY and SELL. The signal is born when the line changes colour on a closed candle. Red to green: buy. Green to red: sell.

Percentile levels. Green lines are targets (P25, P50, P75, P90) and red lines are drawdowns, built from price's previous legs. P50 is where half the previous legs got to; the further away, the fewer times price got there.

03

The confirmations

Before taking a flip, run through these confirmations. If any of them fails, wait for the next one.

1. The flip has closed: the signal candle has already closed on the other side of the line.
2. There's room to the first target: no recent high or low between the entry and P25/P50.
3. The higher timeframe agrees: on the 1 hour chart the line is the same colour.
4. Size is based on risk: the distance to the line changes from day to day, so the lot size has to change too.

04

Entry and management

1. Read the trend from the line's colour and wait for the flip; don't try to guess tops or bottoms.
2. With the flip closed, check the room to P25 and P50 and the higher timeframe's direction.
3. Stop on the other side of the line. Work out the size so you only risk the share of the account you decided on.
4. Enter on the close of the signal candle or the open of the next one; don't chase price if it has already run.
5. Once price moves in your favour, move the stop to the entry point.
6. Exit in parts: some at P25, some at P50, and the rest with the stop following the line up to P75/P90 or until a close on the other side.

05

When not to enter

- When the line flips several times in a row (ranging market).
- When the first target is right next to a recent high or low.
- When the higher timeframe says the opposite.
- When the entry is far from the line (too much risk).
- With a fixed lot: risk per trade ends up depending on the day's volatility.

06

In practice

Stop on the line. If price closes on the other side of the line, the trend is over and the signal is no longer valid.

Protect and exit in parts. Stop to entry early, partials at P25 and P50, and the rest following the line.

Ranging: stay out. Back-to-back flips with no direction: every signal looks good, none has room to run.

07

Pocket checklist

- [ ] Flip closed
- [ ] Room to P25
- [ ] Higher timeframe agrees
- [ ] Stop beyond the line
- [ ] Size by risk
- [ ] Stop to entry early
- [ ] Partials at P25 and P50
