MORE THAN MONEY · MTM STRATEGIES

MTM Scanner

Read the structure before you enter: three double averages, the volume POC as the trigger and market structure, with an ATR stop and targets up to 1:6.

Strategy guide

STYLE

Trend following with a POC trigger, from scalping to intraday

ASSETS

Forex, indices, gold and crypto

TIMEFRAMES

15 minutes as the base; 5 minutes for more signals; 1 hour for longer trades

01

The strategy in a nutshell

MTM Scanner brings together three double exponential moving averages (15, 50 and 238), the volume POC and market structure. It works on any asset and timeframe on TradingView.

The signal is born when the close crosses the POC, the price with the most volume over the last 14 candles, with the averages in favour. The scanner immediately draws the entry, a 1 ATR stop and three targets at 1:2, 1:4 and 1:6.

Structure (breaks and changes of character, liquidity traps) and the momentum and exhaustion phases tell you whether the path is clear and whether the move still has strength.

02

What you see on the chart

Three double averages. Blue: 15 (short term). Green: 50 (medium term). Yellow: 238 (long term). Stacked in the same direction, the trend is aligned across every time frame.

The POC. The price with the most volume over the last 14 candles: the recent balance point. The dashed gold line keeps adjusting.

The signal. The close crosses the POC with the averages in favour: above to buy, below to sell.

Entry, stop and targets. Stop at 1 ATR (or a percentage) and targets at 2, 4 and 6 times the risk, drawn on the signal.

Market structure. Breaks of structure (continuation) and changes of character (reversal), with liquidity traps.

03

The confirmations

Use the scanner's pieces as a filter. With all four confirmations, the signal has the context on its side.

1. Stacked averages: on a buy, 15 above 50 and 50 above 238 (the opposite on a sell).
2. A close on the right side of the POC, which is left behind as support.
3. Structure in favour: a recent break of structure in the signal's direction and a clear path to the first target.
4. A momentum phase, not an exhaustion phase.

04

Entry and management

1. Read the averages' context and wait for the POC trigger.
2. Check the structure and the room to the first target.
3. Measure the distance to the stop and size by risk.
4. Enter on the close of the signal candle or the open of the next one.
5. At the first target (1:2), close part of the position and move the stop to entry.
6. Let the rest go towards 1:4 and 1:6 while the averages stay stacked; exit earlier on a change of character against you or an exhaustion phase.

05

When not to enter

- With tangled averages and price moving sideways (the close crosses the POC all the time).
- With an important high or low between the entry and the first target.
- In an exhaustion phase.
- With price already far from the signal.
- With a fixed lot instead of sizing by risk.

06

In practice

Protect at the first target. At 1:2 close part of the position and move the stop to entry; the rest runs to 1:4 and 1:6.

Tangled averages: wait. Every POC cross looks like a signal, but none has a trend behind it.

07

Pocket checklist

- [ ] Stacked averages
- [ ] Close beyond the POC
- [ ] Structure in favour
- [ ] Clear path to 1:2
- [ ] Momentum phase
- [ ] Size by risk
- [ ] Stop to entry at 1:2
