STYLE

Trend-following, with pullback entries

ASSETS

Cryptocurrencies (including Bitcoin), forex pairs, indices, gold and oil. All the examples are forex

TIMEFRAMES

Scalping from 1 to 5 minutes; intraday on 15 or 30 minutes or 1 hour; longer positions on 4 hours or daily. The examples use 15 minutes, on the same chart for analysis and entry

01

The strategy in a nutshell

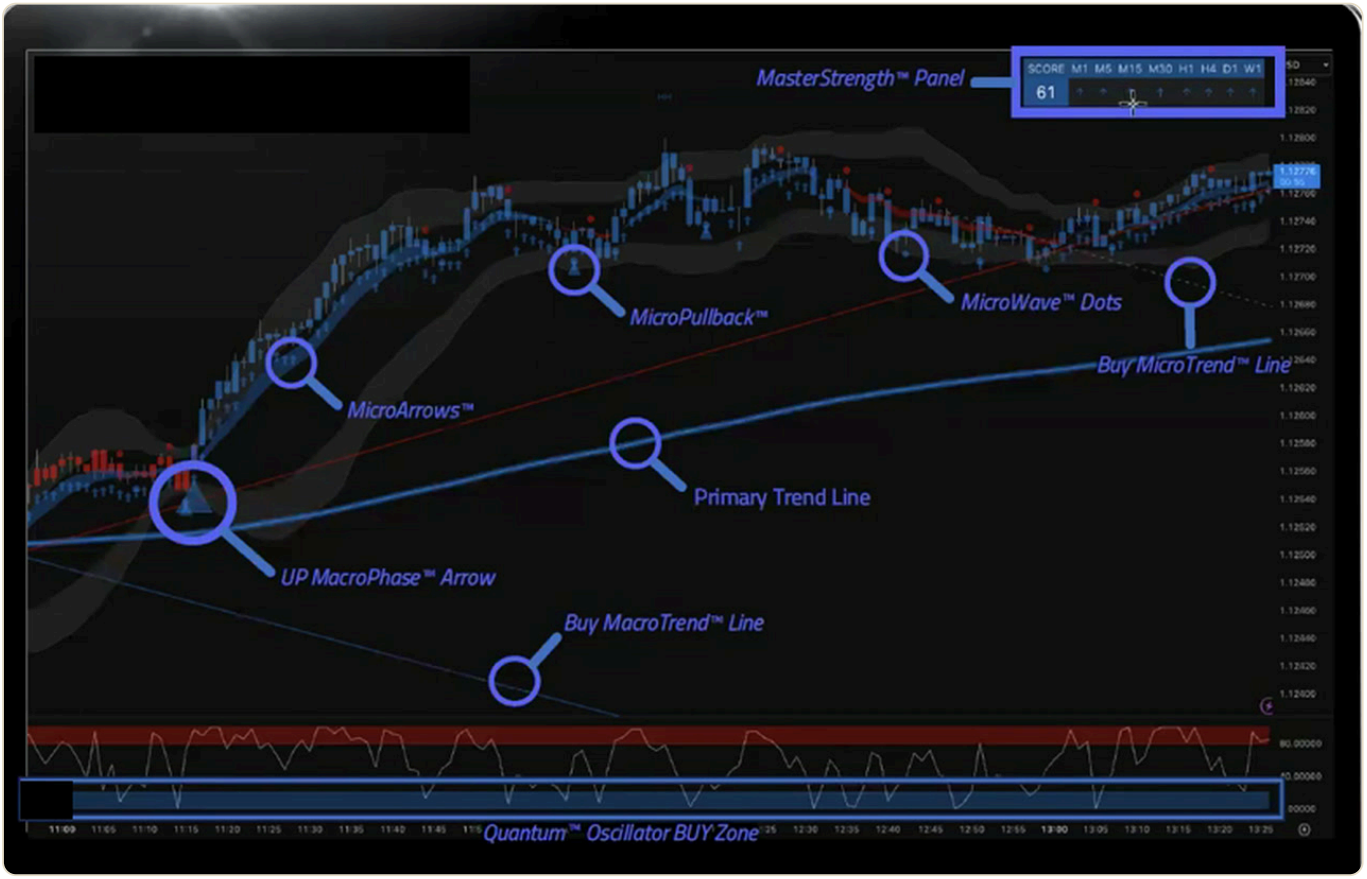

Quantum is a set of automatic tools that reads direction, price action and price phase, to make analysis simpler. It works for scalping, intraday or longer positions, depending on the timeframe.

The logic has three beats: confirm the trend (phase, primary line and strength panel), wait for price to pull back, and enter when the oscillator is in the zone of the direction and the entry signal appears.

The indicator's source doesn't set a stop or targets. In this guide, management follows the MTM rule described further down. Practise on demo first.

02

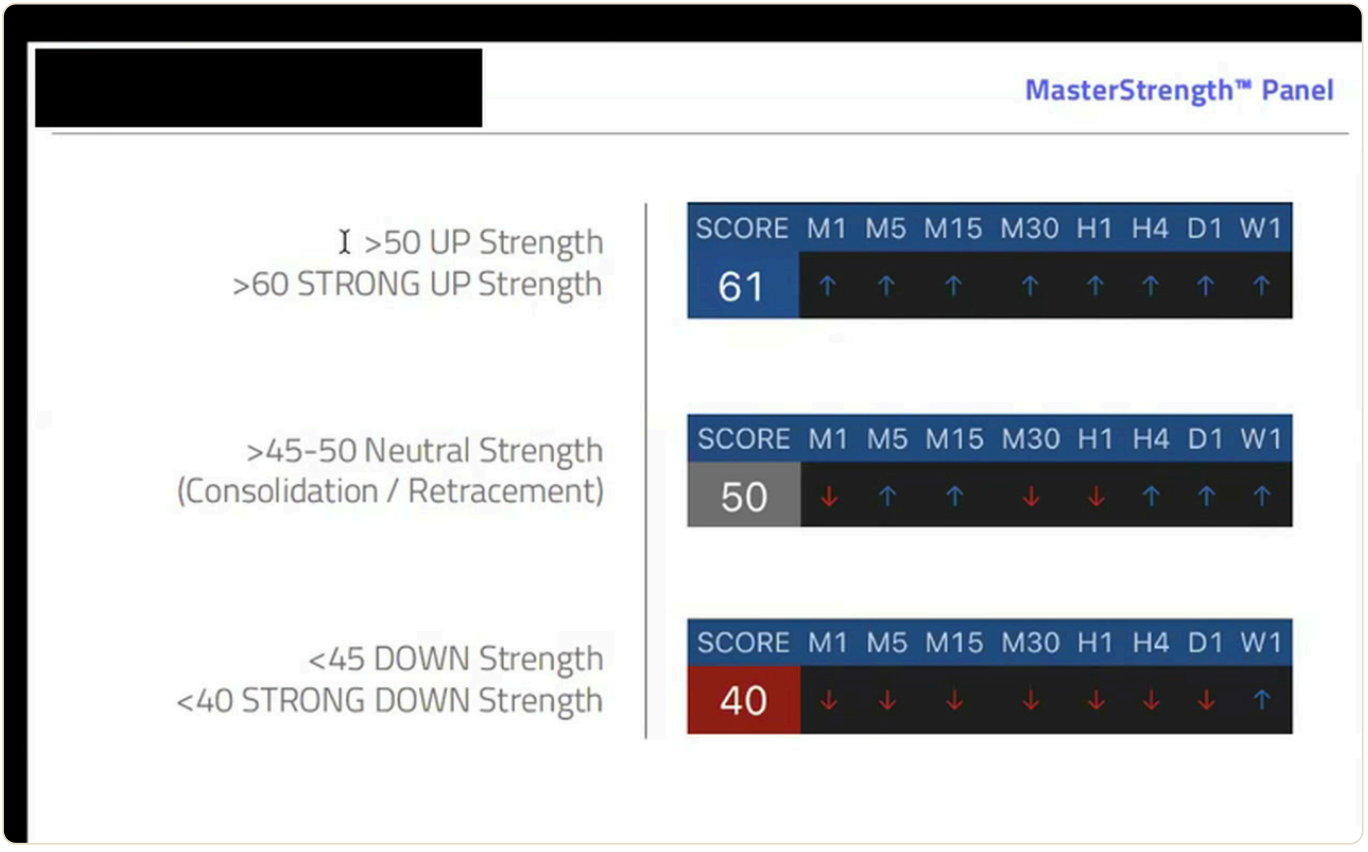

What you see on the chart

Uptrend. The big phase arrow (MacroPhase) marks the start of the trend. The blue primary line means price is above it. On top of that, the small arrows, the pullback triangles (MicroPullback) and the MicroWave dots.

Downtrend. The mirror image: phase arrow down, red primary line, red candles, a score of 36 and the oscillator in the red sell zone.

MasterStrength panel. A score and an arrow per timeframe, from M1 to W1. Above 50 there's bullish strength and above 60 strong bullish strength. Between 45 and 50 is neutral, below 45 bearish and below 40 strongly bearish.

Rules for an uptrend. Conditions: blue phase, blue primary line and a score above 60. Entries: blue dots, blue triangles and the oscillator in the blue zone. The transition zone is a red phase with blue arrows.

Rules for a downtrend. Conditions: red phase, red primary line and a score below 40. Entries: red dots, red triangles and the oscillator in the red zone.

03

The confirmations

Follow the confirmations in this order, without skipping any. The list is for a buy; a sell is the mirror image.

1. Phase. The big MacroPhase arrow in the direction: up for a buy, down for a sell.
2. Primary line. Blue to buy and red to sell, with price on the right side of it.
3. Score. Buy with a score above 60. Sell with a score of 40 or below.
4. Aligned timeframes. The entry timeframe plus the next three, all with the arrow in the direction. On 15 minutes that's M15, M30, H1 and H4. Some prefer all of them aligned.
5. Candles. In the colour of the direction, with the small arrows in the right colour: blue on a buy, red on a sell.
6. Oscillator. Inside the zone of the direction: blue on a buy, red on a sell.
7. Entry signal. Pullback triangle, MicroWave dot or both, in the direction's colour and on a candle of that colour. You don't need both, but on the same candle the entry is stronger.
8. Optional extra. Candle at the lower volatility band on a buy, or the upper band on a sell.

04

Entry and management

1. Confirm the trend: phase, primary line, score and aligned timeframes.
2. Wait for the pullback: the oscillator enters the zone of the direction.
3. Enter on the triangle and/or the dot in the direction's colour. Both on the same candle, with price at the volatility band, gave the strongest moves in the examples.
4. Stop (MTM management rule): beyond the last low of the pullback on a buy, or the last high on a sell.
5. Target (MTM management rule): at least twice the risk. Work out your risk and position size before entering.
6. Depending on where you place the stop, earlier entries without triangle and dot together may be stopped out before the main move.

05

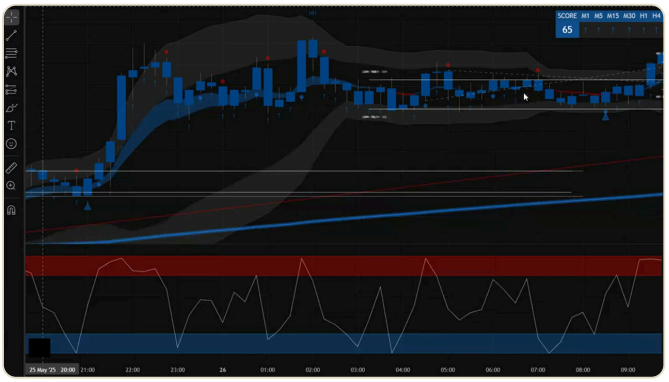

When not to enter

- In long consolidations with the volatility bands closed. Wait for the bands to open.
- With a neutral score (45 to 50) and mixed arrows on the panel.
- With candles in the colour opposite to the direction.
- Without the timeframes aligned.
- Without price at the volatility band, when you want the strongest entry: in the EURNZD and AUDNZD examples, those entries moved less.

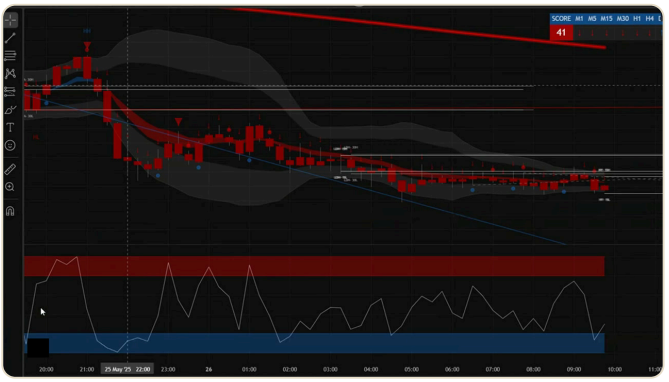

- On a live account without first practising the strategy on demo.

06

In practice

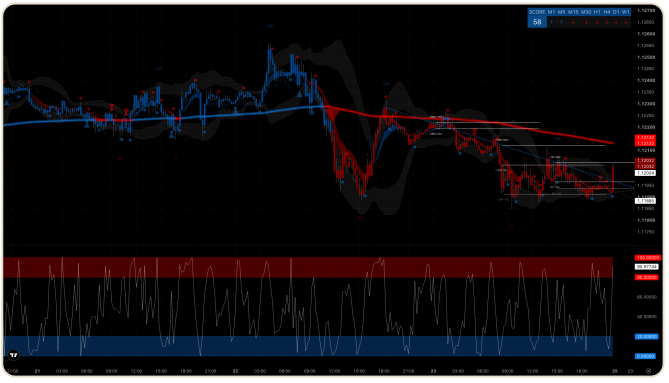

NZDCAD, buy on 15 minutes. Blue primary line, a score of 65 and aligned timeframes. The oscillator drops into the blue zone and a blue triangle gives a sizeable rally. The last entry has a blue triangle and dot on the same candle. Then comes a consolidation with closed bands: no trading.

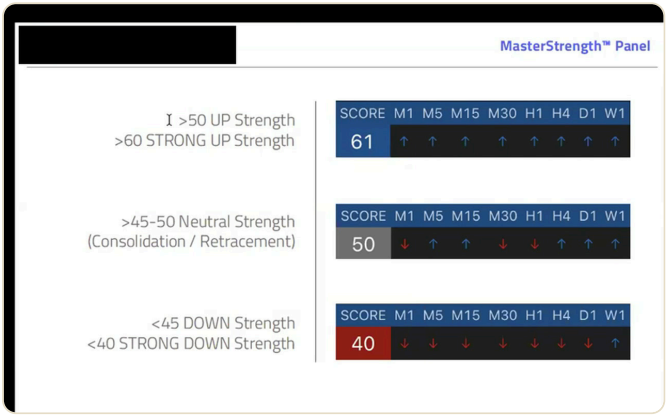

EURNZD, sell on 15 minutes. Red line, a score of 41 and M1 to H4 bearish. Oscillator in the red zone, price at the upper band, red triangle and dot on the same candle and a sizeable decline. Two later entries, without price at the upper band, didn't make the same move.

AUDNZD, sell on 15 minutes. Red line and a score of 36. Two potential entries, with the oscillator in the red zone and price at the upper band, could have been stopped out. Then a triangle and dot on the same candle and a strong decline.

Panel with mixed arrows. On EURUSD 15 minutes the panel's arrows don't all point the same way: M1 and M5 up, M15 to W1 down. Without aligned timeframes, it's not an entry.

Three panel readings. A score of 61 with all arrows up, 50 neutral with mixed arrows and 40 with arrows down (except the weekly). Alignment can be read at a glance.

07

Pocket checklist

- [ ] Phase arrow in the direction
- [ ] Primary line in the right colour, with price on the right side
- [ ] Score above 60 on a buy, or 40 or below on a sell
- [ ] Entry timeframe and the next three aligned
- [ ] Candles and small arrows in the direction's colour
- [ ] Oscillator inside the zone of the direction
- [ ] Triangle and/or dot in the direction's colour (both is better)
- [ ] Volatility bands open, ideally with price at the band
- [ ] Stop beyond the last low (buy) or high (sell) of the pullback
- [ ] Target at least twice the risk
