MORE THAN MONEY · MTM STRATEGIES

TrendShot

Scalping with the trend: the cross gives the signal, the histogram gives the direction, and the stars and structure tell you how long to hold.

Strategy guide

morethanmoney.pt

STYLE

Trend-following scalping (pip surfing): trades lasting minutes to a few hours

ASSETS

Indices such as the US30, gold (XAUUSD), BTC and forex pairs

TIMEFRAMES

1 minute (hyper-scalping) and 5 minutes (session scalping)

01

The strategy in a nutshell

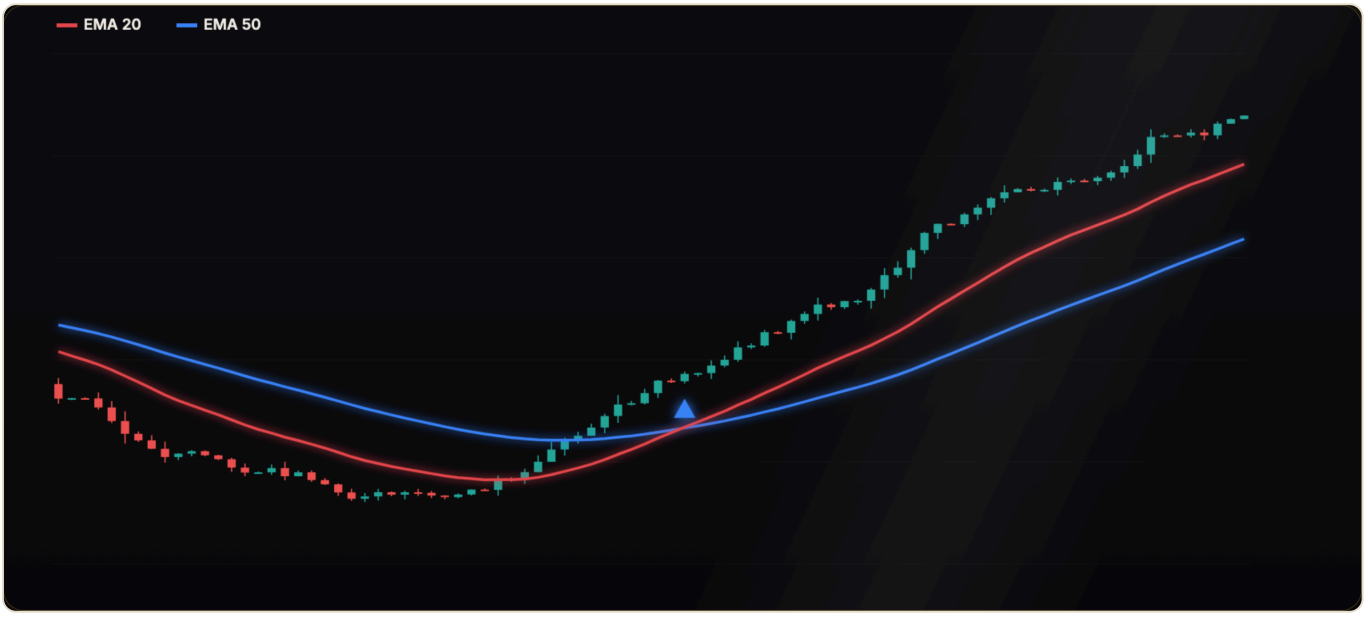

TrendShot is a trend-following scalping system: we always enter in the direction the market is already moving. It works mainly on the 1 and 5 minute charts, so trades play out in minutes, at most in a few hours.

The signal comes from the cross of two exponential moving averages: the red 20 and the blue 50. The background histogram shows the direction, the stars warn of possible reversals and the automatic support and resistance lines show where price may stall.

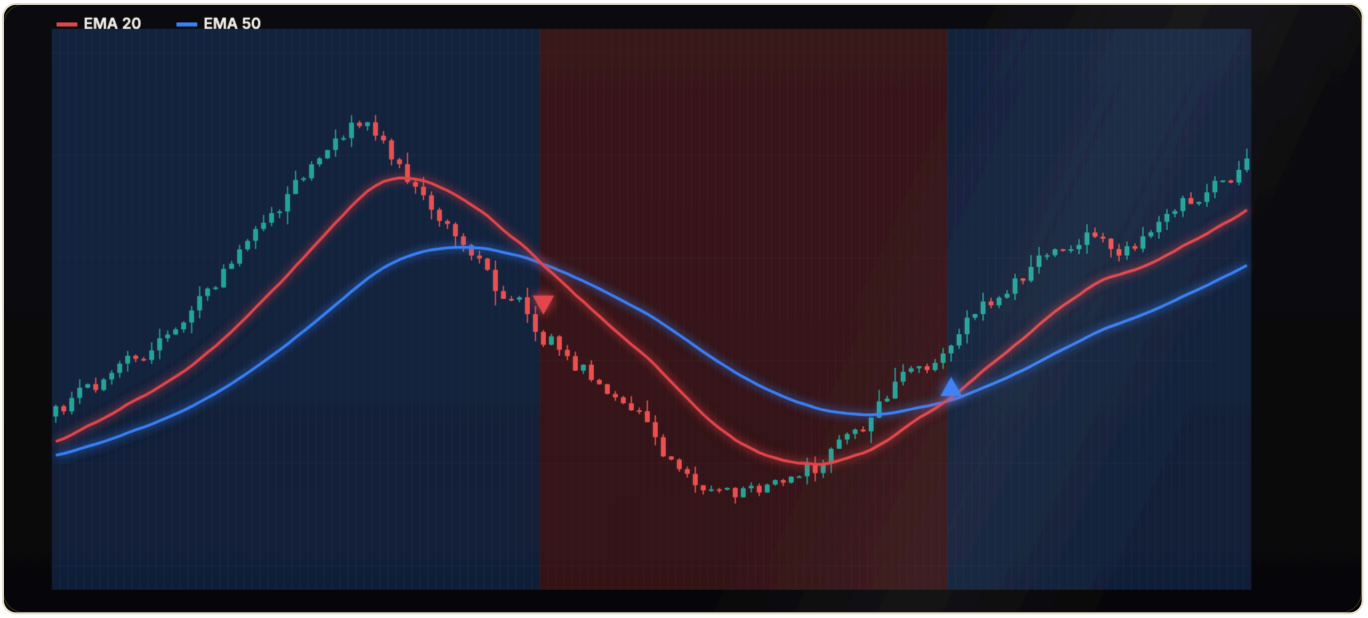

Before taking a signal you always go through four confirmations: trend on two higher timeframes, the 238 average behind you, the POC behind you and Good Volume. Risk is always 1 to 2. On TradingView, TrendShot by MTM comes with the averages preconfigured.

02

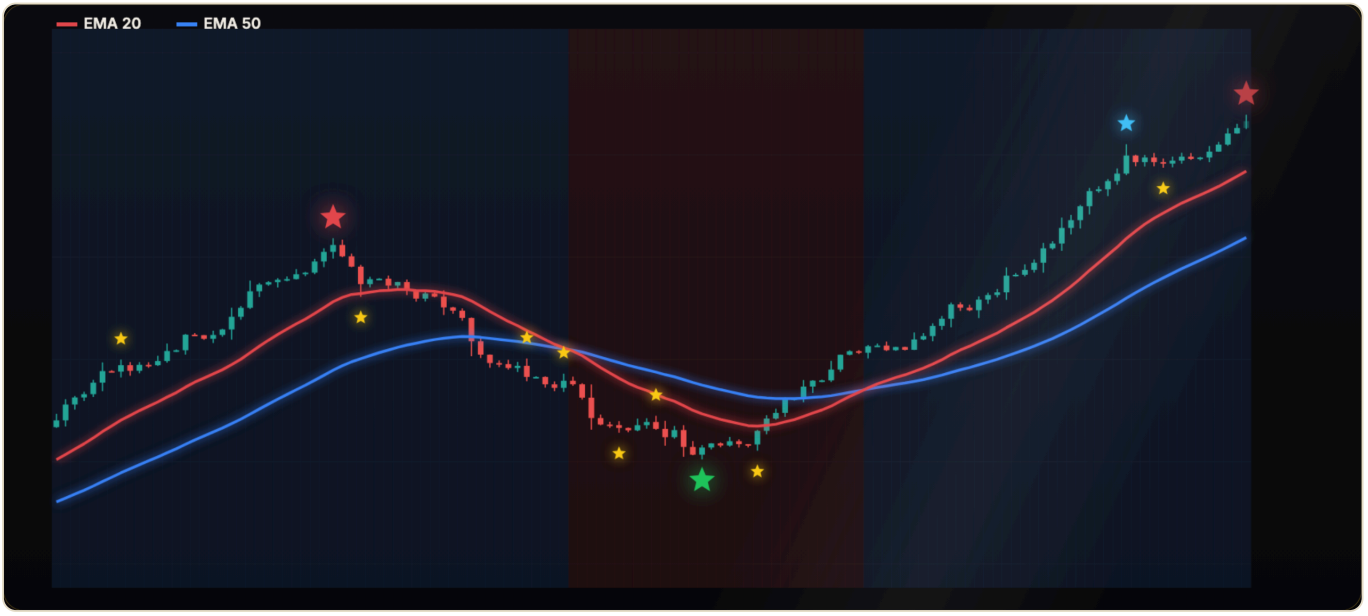

What you see on the chart

The signal: the 20/50 cross. When the red average (20) crosses above the blue one (50), a blue triangle appears: buy. When it crosses below, a red triangle: sell. Every switch marks a short change in direction.

The background histogram. Blue while the 20 is above the 50 (uptrend), red when it's below (downtrend). With a blue background you look for buys, with a red one you look for sells, and you hold the trade while the colour doesn't change.

The stars. Reversal warnings that move with price until they settle. Yellow: small pullback. Blue: deeper pullback without changing the trend. Red (in a rally) and green (in a decline): a possible trend reversal. If price runs through a star, it wants to keep going in that direction.

Automatic market structure. Green lines above price are resistance; red lines below are support. When price breaks a resistance, the line turns red and becomes support, and the retest is often where the averages and the structure work together.

Trend table, 238 average, POC and volume. The table shows direction across several timeframes. The orange line is the 238 average (on the 1 minute chart it matches the 50 on the 5 minute chart). The dashed gold line is the POC, the level with the most volume. The corner shows Good Volume or Low Volume.

03

The confirmations

Before taking a signal, go through these four confirmations. If any of them fails, let it go: a missed weak signal costs you nothing.

1. Are we trending? Look two timeframes above yours. On the 1 minute chart you check the 5 and the 15; on the 5 minute chart, the 15 and the 30. You want the same direction on all three (the trend table shows it at a glance).
2. The 238 average behind you. On a buy, the orange line has to be below price; on a sell, above it.
3. The POC behind you. On a buy, the POC below price; on a sell, above it. If it isn't behind you yet, make sure there's enough room to it and factor it into the target.
4. Good Volume. The scanner performs best with liquidity and fast moves. Trading on Low Volume isn't forbidden, but moves tend to be shorter.

04

Entry and management

1. Read the direction: histogram colour and trend table.
2. Wait for the 20/50 cross triangle and check there are no stars or resistance blocking the path right after it.
3. Go through the four confirmations. Only enter if they're all met.
4. Stop: on the other side of both averages, the red and the blue.
5. Target: at least twice the stop (1:2 risk-reward). Example: a 25 pip stop, a 50 pip target. The POC and earlier major stars help fine-tune the target.
6. Management: if you're in a buy and a red star appears, or in a sell and a green one appears, always protect the trade by moving the stop to entry or into profit. The star is a protect order, not an exit order.

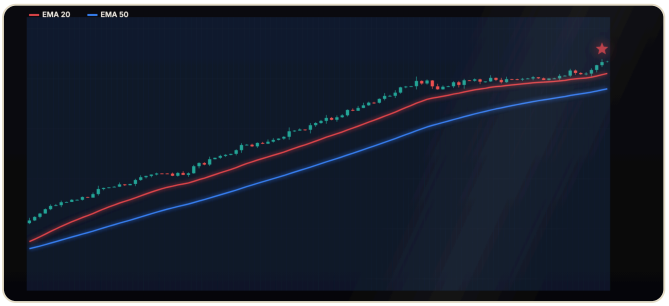

05

When not to enter

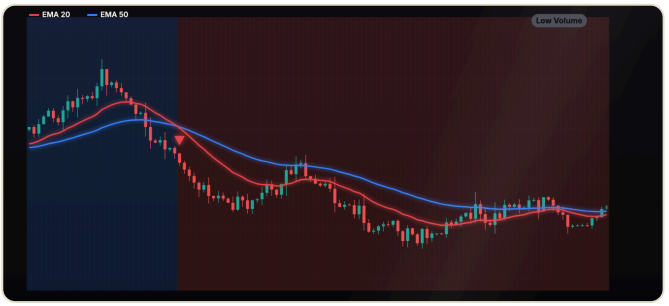

- With tangled averages and signals flipping back and forth (ranging market).
- With the signal right under resistance (or above support), with no room to the target.
- With the trend table showing different directions on the higher timeframes.
- With the 238 average or the POC on the wrong side and no room.
- Outside the higher-volume windows (Lisbon time, winter): avoid 16:00 to 17:30, 20:45 to 00:00 and 04:00 to 06:30.
- Treating every yellow star as an exit: they show up often and are usually just pullbacks.

06

In practice

Entry, stop and a 1:2 target. A buy on the cross, the stop on the other side of both averages and the target at twice the distance. The red star along the way is the cue to protect the trade.

Ranging and Low Volume: stay out. Tangled averages, a histogram flipping colour and low volume. There's no wave to catch here.

Stars on a real chart. The red star marks the top of the rally, the sell follows, the green star marks the bottom and a new move up begins.

Turning bullish. The histogram goes from red to blue, price crosses above the 238 average and the buy signal appears, with yellow and blue stars along the way.

No-trade zone. Alternating arrows, a histogram changing colour and tangled averages: consolidation. These signals aren't taken.

Arrow and star on the same candle. The buy signal shows up on the same candle as a big red star, a reversal warning on a buy. This one is best left alone.

07

Pocket checklist

- [ ] Triangle on the 20/50 average cross
- [ ] Histogram in the signal's colour
- [ ] Same direction two timeframes up
- [ ] 238 average behind price
- [ ] POC behind price or with room to it
- [ ] Good Volume
- [ ] No major stars or resistance right ahead
- [ ] Stop beyond both averages and a 1:2 target
- [ ] Reversal star = protect the trade
